IKEA Saudi Arabia Catalog Analysis | Catalog, Price and Rating Review

1	**Executive summary**	The four findings on one page	3
2	**Scope and data**	What I looked at and what I asked	4
3	**The dashboard**	What the Excel page shows	5
4	**How the analysis was built**	From source file to statistical tests	6
5	**Cleaning steps and checks**	What was wrong and what I fixed	7
6	**Product groups**	Which groups make up the catalog	8
7	**Largest categories**	Where most products sit	9
8	**Price distribution**	How prices spread across bands	10
9	**Prices are skewed**	Why the median is the typical price	11
10	**Price by category**	Which categories cost the most	12
11	**Customer ratings**	How rated products score	13
12	**Ratings rest on few reviews**	Why raw 5.0 scores mislead	14
13	**Ratings by price band**	Which prices get rated	15
14	**Price and rating score**	Does price predict the score	16
15	**Offers and statistical tests**	Three tests, three answers	17
16	**Limits of the data**	What this file cannot tell	18
17	**Recommendations**	What I would do next	19

Executive summary

The four points a manager needs from this report

01 Almost every row needed cleaning first

6,846 of 7,556 rows (90.6%) had at least one data gap, mostly a missing rating. Power Query now repeats the fixes on every refresh.

02 Storage and Furniture make up 54% of the catalog

Storage (2,387) and Furniture (1,723) hold 4,110 of 7,556 products. Storage & Organisation alone is 26.5%.

03 Prices are heavily skewed

The median price is SAR 169 and the average is SAR 686, 4.1 times higher. 53% of products cost under SAR 200, and 881 products (11.7%) are outliers.

04 Rating follows price, and offers follow fewer top sellers

Only 27% of products are rated, and cheaper ones far more often ($p < 0.001$). Offers do not change ratings ($p = 0.11$), but offer products are Top Sellers less often (3.6% against 5.5%, $p = 0.003$).

Note: rating figures cover only the 27% of products that have a rating (2,048 of 7,556). Prices are in SAR.

Scope and data

What I looked at, and the questions I started with

1

What does the catalog contain?

Which categories and product groups matter most

2

How are prices spread?

Whether the average price tells the real story

3

What goes with ratings and top sellers?

Price, offers and category, checked with statistical tests

The dataset

7,556

products, 19 raw columns

SAR 169

median price

27%

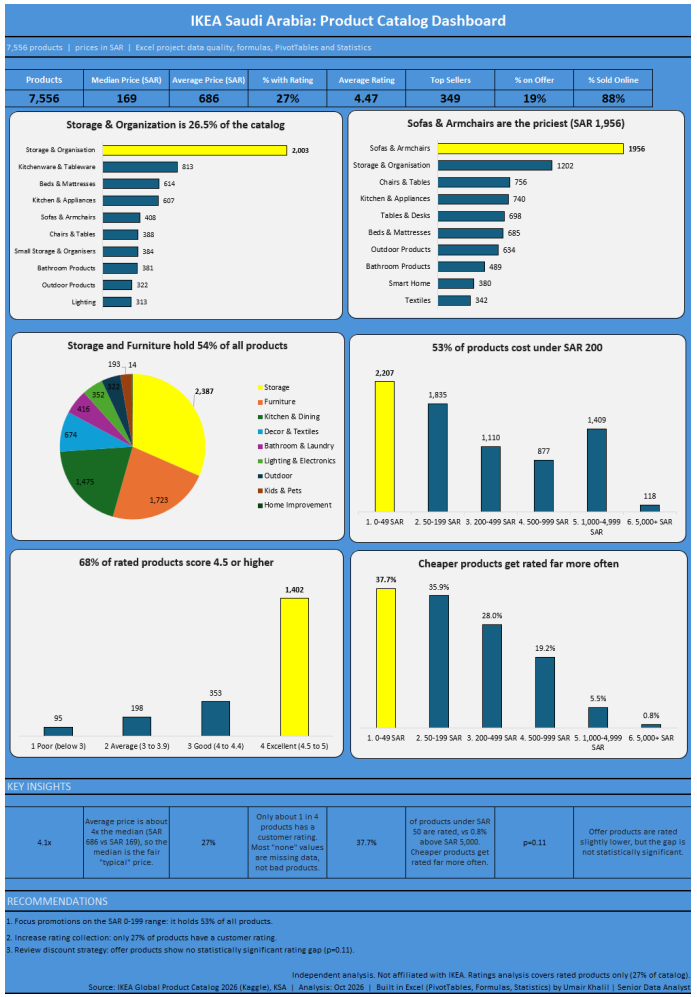

of products have a rating (2,048)

IKEA Saudi Arabia (KSA), prices in SAR

Method: audit and clean the data, summarise it with Excel formulas and PivotTables, and test gaps with statistics. **Limit:** the file has no sales, quantity or date columns, so revenue and trends are out of scope. Source: IKEA Global Product Catalog 2026 (Kaggle), KSA. Independent analysis, not affiliated with IKEA.

The Excel dashboard

One report page that tells the story from KPIs to recommendations

What the page shows

KPI cards

Eight KPIs: products, prices, ratings, top sellers, offers and online share.

Category charts

Top 10 categories by number of products, and top 10 by price.

Product groups and prices

Share of products by group, and how many products sit in each price band.

Rating charts

How rated products score, and how often each price band is rated.

Insights and recommendations

Four takeaways and three actions, with the data source and a disclaimer.

Dashboard built in Microsoft Excel. Source: IKEA Global Product Catalog 2026 (Kaggle), KSA.

How the analysis was built

From the source file to statistical tests, all inside one Excel workbook

1

Fetch

Kaggle IKEA Global Product Catalog 2026, KSA sheet: 7,556 rows and 19 columns.

2

Check

A live-formula audit sheet runs 17 checks on the untouched raw data.

3

Clean

One Power Query script fixes types, names, IDs and encoding, and repeats on refresh.

4

Summarise

Formulas such as COUNTIF, AVERAGEIF and SUMPRODUCT, plus 5 PivotTables.

5

Test

Welch t-test, z-test, chi-square, correlation and regression show if gaps are real.

In plain words

Power Query saves every cleaning step and runs it again when the data changes. A live formula recalculates by itself. A p-value is the chance of seeing a gap this big if there were no real difference.

Why cleaning came first

6,846 of 7,556 rows (90.6%) had at least one data gap, mostly a missing rating. The first job was cleaning, not charting.

Cleaning steps and checks

What the audit found in the raw file, and what I did about it

#	Check	What I found	What I did
1	**Duplicates and prices**	0 duplicate IDs, 0 zero or blank prices	Kept all 7,556 rows; every price is usable
2	**Product IDs**	730 IDs lost their leading zeros	Restored to 8 digits, stored as text
3	**Broken letters**	2,354 names and 2,462 descriptions	Fixed the encoding (Ö had become Ã–)
4	**"none" in ratings**	5,508 ratings and rating counts	Rating left blank and count set to 0, so averages work
5	**Missing sizes**	1,841 measurements written as "none"	Kept and flagged as "No size"
6	**Constant columns**	Discount, Currency and Country hold one value	Dropped in Power Query
7	**Store-only products**	870 products not sellable online	Kept and flagged

90.6% of rows (6,846 of 7,556) had at least one data gap, mainly a missing rating. After cleaning, every product keeps its row.

Storage and Furniture hold 54% of all products

Number of products by product group

	Product group	Products	Share
	Storage	2,387	31.6%
	Furniture	1,723	22.8%
	Kitchen & Dining	1,475	19.5%
	Decor & Textiles	674	8.9%
	Bathroom & Laundry	416	5.5%
	Lighting & Electronics	352	4.7%
	Outdoor	322	4.3%
	Kids & Pets	193	2.6%
	Home Improvement	14	0.2%

54% of all products are Storage or Furniture (4,110 of 7,556)

Storage & Organisation is 26.5% of the catalog

Top 10 categories by number of products

26.5%

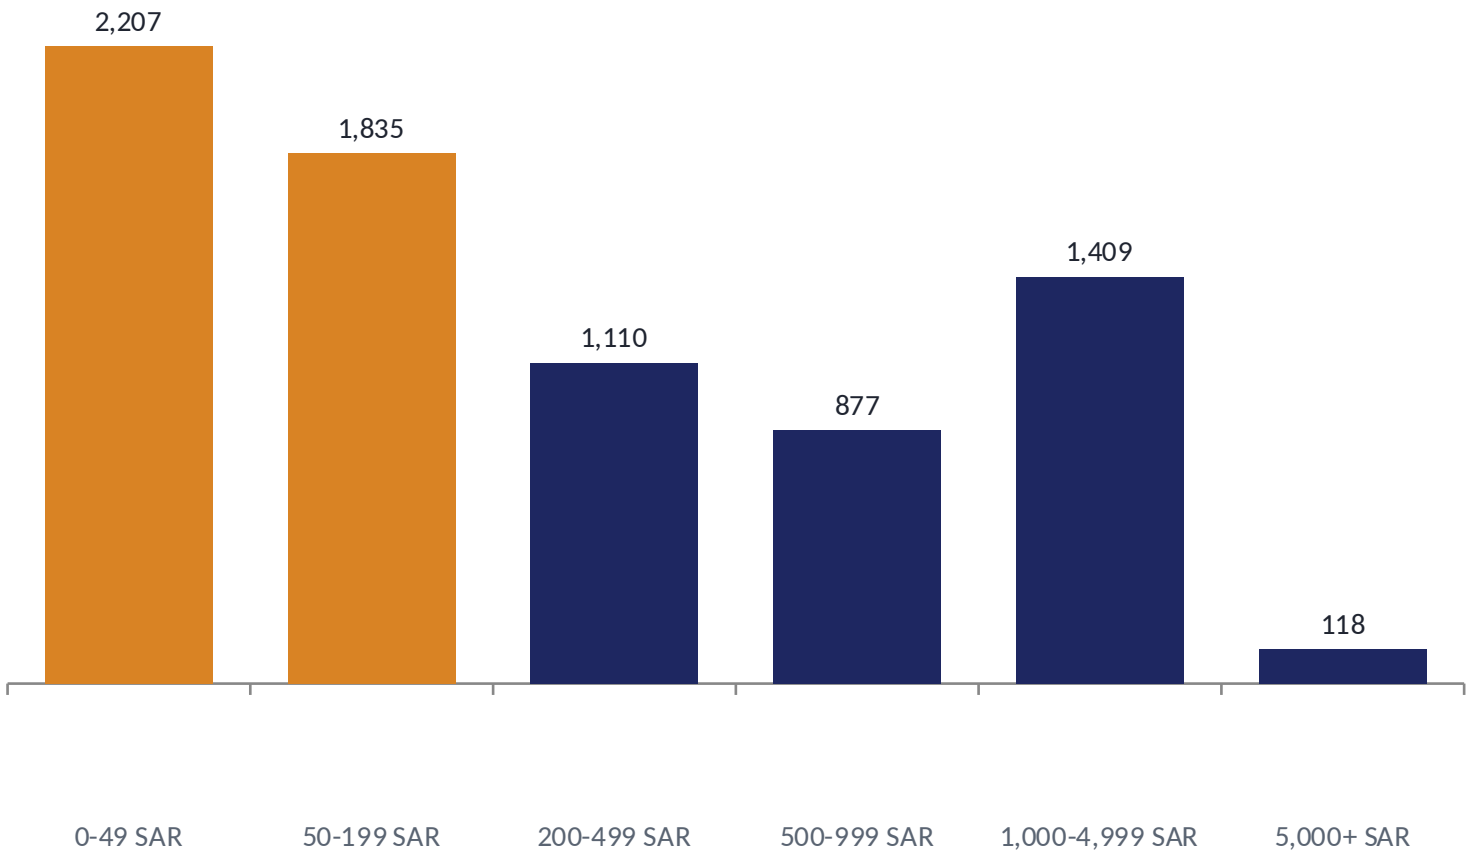

of the catalog is Storage & Organisation (2,003 of 7,556 products)

What this means

- About 2.5 times the next category, Kitchenware & Tableware (813)
- The 10 largest categories hold 82% of all products
- Storage & Organisation is also second on price (page 12)

53% of products cost under SAR 200

Number of products by price band (SAR)

53%

of products cost under SAR 200 (4,042 of 7,556)

What this means

- Median price is SAR 169, average is SAR 686 (4.1 times higher)
- The count rises again at SAR 1,000-4,999, with 1,409 products
- Only 118 products cost SAR 5,000 or more

Prices are heavily skewed, so use the median

Descriptive statistics for the price of all 7,556 products (SAR)

Measure	Value	What it means
Median	**SAR 169**	The middle product, the fair typical price
Mean	**SAR 686**	Pulled up by expensive items
Most common price	**SAR 19.95**	The mode
Middle half of products	**SAR 39.95 to 775**	Q1 to Q3, the spread of the middle half
Maximum	**SAR 12,845**	Against a minimum of SAR 1.45
Outliers	**881 (11.7%)**	Above the fence of SAR 1,878
Skewness	**3.08**	Above 1 means a long tail of high prices

4.1x

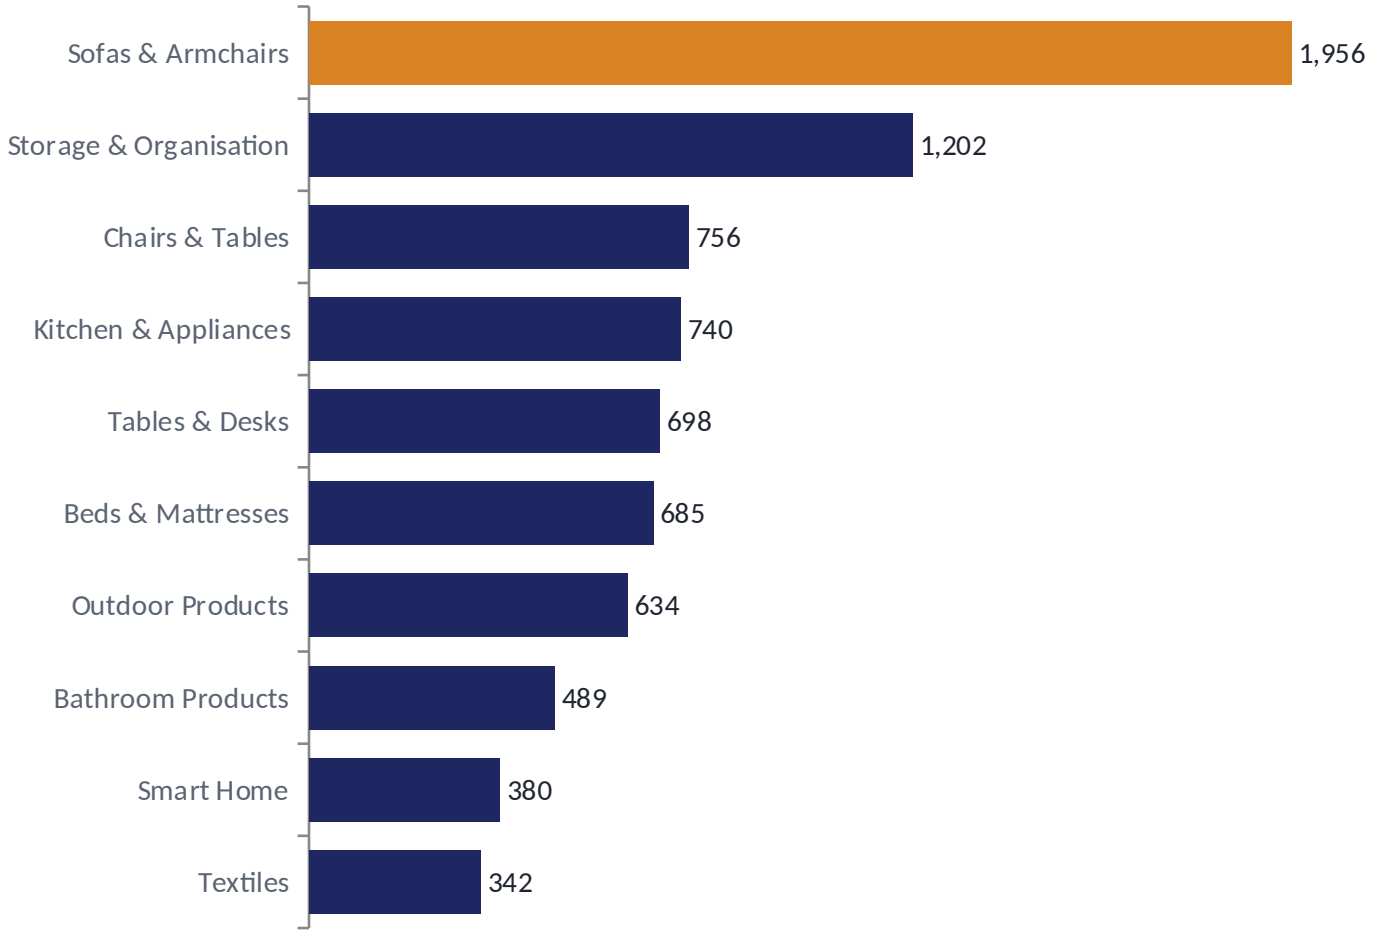

the mean is 4.1 times the median (4.06), far above 1

What this means

- Report the median, not the mean, as the typical price
- 881 products lie above the outlier fence of SAR 1,878
- The standard deviation (SAR 1,186) is larger than the mean, so prices are very spread out

Sofas & Armchairs are the priciest at SAR 1,956

Top 10 categories by average price (SAR)

SAR 1,956

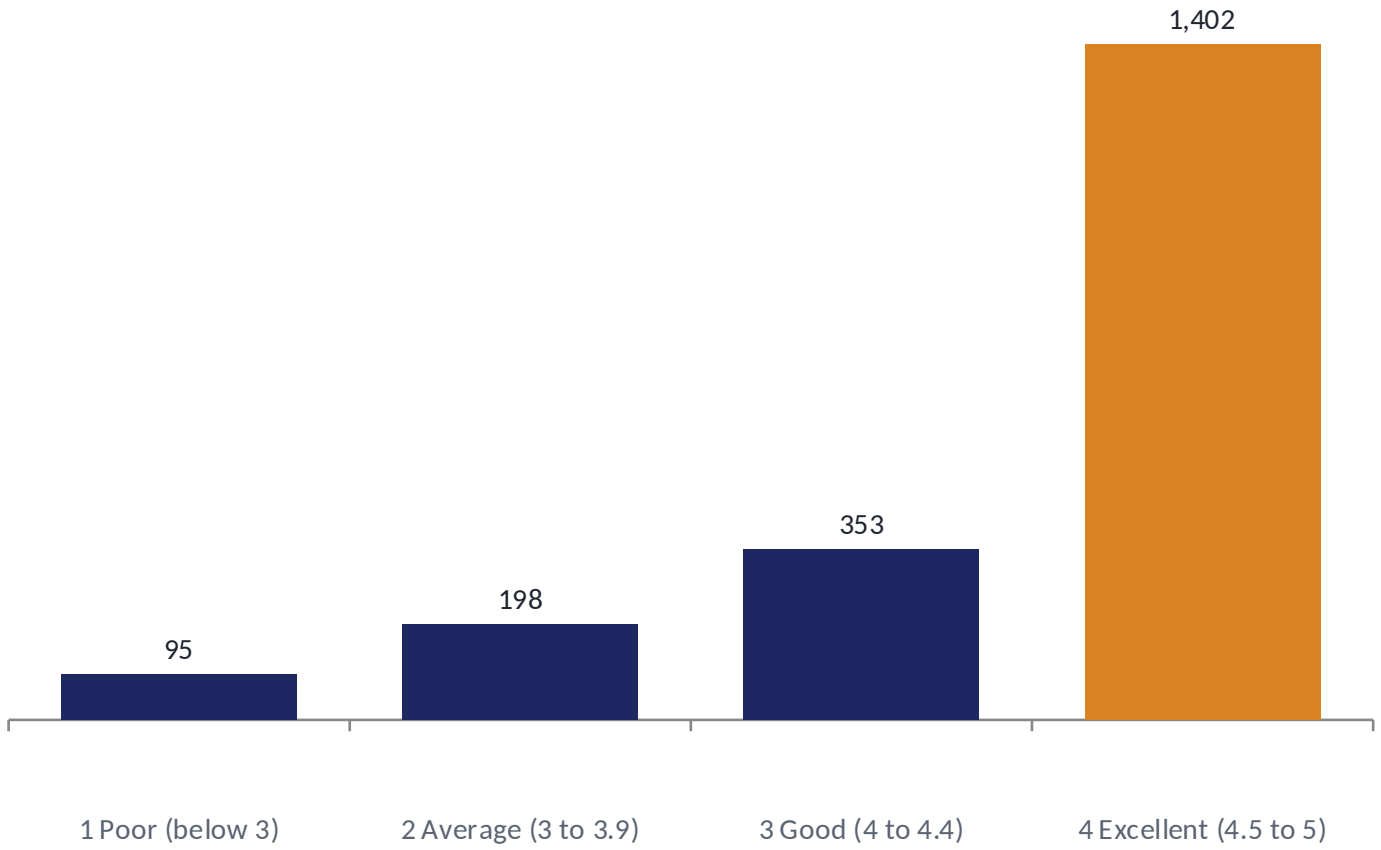

is the average price of Sofas & Armchairs, the priciest category

What this means

- About 1.6 times Storage & Organisation (SAR 1,202)
- Storage & Organisation averages SAR 1,202 but its median is SAR 628, so a few items lift it
- Averages fall to SAR 342 by the tenth category, Textiles

68% of rated products score 4.5 or higher

Number of rated products by rating level

27%

of products have a rating (2,048 of 7,556)

4.47

average rating of the rated products

68%

of rated products score 4.5 or higher (1,402 of 2,048)

Many 5.0 ratings rest on only a few reviews

Why the raw rating is a weak way to rank products

45.3%

of ratings are exactly 5.0

3

median reviews per rated product

599

rated products have only one review

4.80

median rating, above the 4.47 average

Why it matters

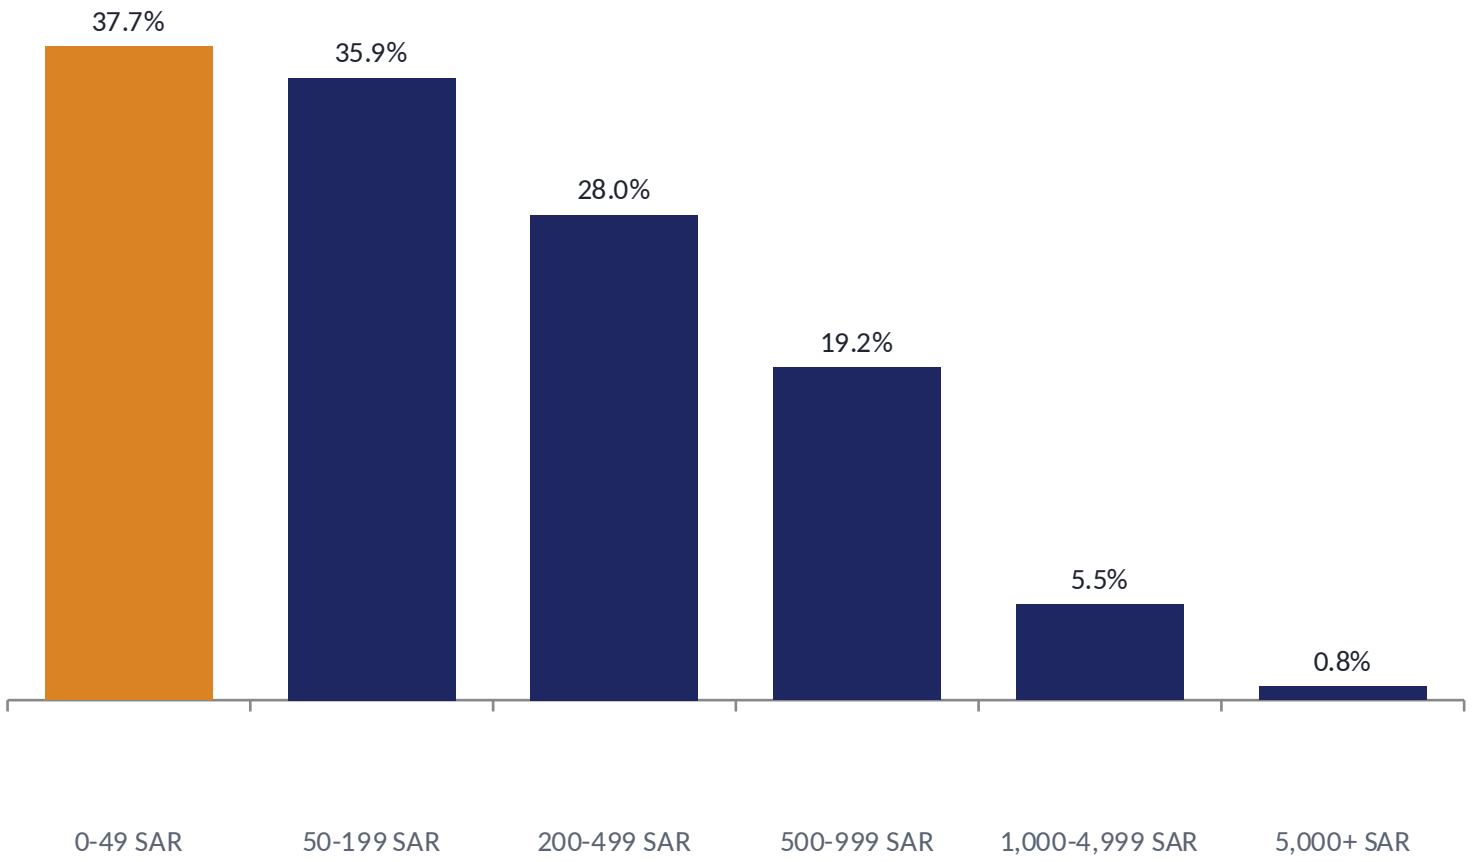

A product with one 5.0 review looks better than a product with 100 reviews averaging 4.7. Most rated products have only a handful of reviews, so the raw score is often noise.

The fix: a weighted rating

It pulls products with few reviews toward the overall average of 4.47, using a minimum of 5 reviews. One 5.0 review becomes about 4.56.

Cheaper products get rated far more often

Share of products with a rating, by price band

37.7% vs 0.8%

of products are rated under SAR 50, against above SAR 5,000

What this means

- The link is statistically significant (chi-square 601, $p < 0.001$)
- Cramér's V is 0.28, a moderate link
- A missing rating usually means no customer data, not a bad product

Price barely moves the rating score

Correlation and simple regression on the 2,048 rated products

-0.05

correlation between price and rating

0.2%

of rating differences explained by price (R^2 = 0.0024)

4.39

predicted rating at SAR 1,000

-0.10

rating change for each extra SAR 1,000

What the numbers say

Every measure is close to zero. A SAR 1,000 product is predicted to score 4.39, against 4.49 at a price of zero. Price does not predict how well a product is rated.

The contrast

Price changes whether a product gets rated (page 15), but not how well it is rated.

Offers do not change ratings, but offer products are Top Sellers less often

Three statistical tests at the 0.05 level

Test	Groups compared	Result	p-value	Verdict
Offer and rating (Welch t-test)	Rated products: no tag (1,613) and offer (324)	Average rating 4.49 and 4.40	**0.109**	Not significant
Offer and top sellers (two-proportion z-test)	No tag (5,268) and offer (1,464) products	Top Seller rate 5.5% and 3.6%	**0.003**	Significant
Price band and rating (chi-square test)	Six price bands, rated and not rated	Rated share falls from 37.7% to 0.8%	**< 0.001**	Significant

How to read it

A p-value below 0.05 counts as significant. This catalog is not a randomised experiment, so the tests show that groups differ, not what causes the difference.

The question it raises

Why are Top Sellers 34% less common among offer products? This file has no sales data, so it cannot say.

Limits of the data

Four limits to keep in mind when reading the results

1

Ratings cover only 27% of products

5,508 products have no rating. They became blanks, so rating results use the 2,048 rated products only.

2

There are no sales, quantity or date columns

Revenue, trends and year-on-year growth cannot be measured from this file. The findings describe the catalog, not sales.

3

The tests show differences, not causes

The catalog is not a randomised experiment. A gap such as fewer Top Sellers on offer needs sales data to explain it.

4

Many 5.0 ratings rest on one or two reviews

599 rated products have a single review. Use the weighted rating, not the raw score, to rank products.

Recommendations

Four actions, in the order I would take them

01 Rank products by weighted rating

Raw scores mislead: 599 rated products have one review. The weighted rating pulls thin scores toward the 4.47 average.

Owner **Reporting**

02 Increase rating collection

Only 27% of products have a rating, and just 0.8% above SAR 5,000. Start with products above SAR 200.

Owner **Customer Experience**

03 Review the offer strategy

Offer products are Top Sellers 34% less often ($p = 0.003$). Add sales data to find out why.

Owner **Pricing**

04 Focus promotions on SAR 0-199

This range holds 53% of products. Report the median (SAR 169) as the typical price, not the average.

Owner **Marketing**

Thank you

Happy to walk through the Excel workbook, or to build the same kind of analysis on your own data.
